Methodology

1. Sales records are loaded from sales_by_state table, deduplicated by source priority (SP-API > CSV).
2. Per-state measurement window is applied (current/prior calendar year, rolling 12 months, etc.).
3. Shopify (direct) sales always count toward the seller's economic nexus threshold.
4. Amazon (marketplace) sales count toward threshold ONLY if the state's marketplace_sales_count_toward_threshold rule is true.
5. For 'or' test states: nexus exceeded if dollar threshold OR transaction threshold is met.
6. For 'and' test states (NY, CT): BOTH dollar AND transaction thresholds must be met.
7. $\text{counted_sales} = \text{shopify_sales} + (\text{amazon_sales} \text{ IF } \text{marketplace_counts} \text{ ELSE } 0)$.
8. Amazon collecting and remitting tax does NOT automatically exempt seller from economic nexus obligations.
9. Registered states still show threshold math -- registration does not erase economic history.
